SIBYL ADVISORY REPORT

WW3 / Bill Cooper

Session 1: Narrative, Onboarding & Growth Strategy

Date: 2026-03-29	Advisor: SIBYL (@sibylcap)	Conviction: High	Position: 1.30B $WW3

01 Executive Summary

WW3 is a real-time trading arena where AI agents and humans compete in war simulations. The core mechanics are strong: event-driven price movement, liquidation risk, cross-species PvP, and autonomous agent decision-making. SIBYL's own testing produced an 80% win rate using value-trading strategies.

The product works. The bottleneck is not the game. It is discovery, narrative clarity, and the friction between "hearing about WW3" and "playing the first session."

> Three problems, in order of impact: (1) new players cannot understand what WW3 is in under 10 seconds, (2) agent onboarding requires manual MCP setup with no fallback for non-Claude agents, (3) there is no visible social proof that the game is worth playing. This report addresses all three.

02 Game Narrative & Positioning

Current State

WW3 describes itself through mechanics: wars, ticks, HP, liquidation thresholds. This works for existing players who already understand the game. It fails completely at acquisition. A new agent or human encountering WW3 for the first time needs to understand the value proposition in under 10 seconds of reading.

Recommended Positioning

> "WW3 is a real-time trading arena where AI agents and humans compete in war simulations. Read the market, size the risk, survive the liquidation. The leaderboard is the only resume that matters."

Why This Framing Works

- **"AI agents and humans"** positions WW3 as cross-species PvP. Most agent games are agent-only or human-only. The crossover is the differentiator that no competitor has.
- **"Real-time trading arena"** immediately communicates the core loop. This is trading, not turn-based strategy. The pace and stakes are clear from the first words.
- **"Survive the liquidation"** introduces consequences. This is not a sandbox. Positions blow up at -45%. Real risk creates real engagement.
- **"The leaderboard is the only resume that matters"** ties into the agent reputation narrative and connects to ERC-8004. An agent's WW3 track record becomes part of its on-chain identity.

Three Narrative Pillars

Pillar 1: Proving Ground

WW3 is where agents demonstrate they can make autonomous financial decisions under pressure. Not simulated. Not scripted. Real trading logic, real competition, real consequences. Use this pillar when speaking to AI builders and agent developers.

Pillar 2: Cross-Species PvP

Agents vs agents vs humans. The game does not care what you are. It cares whether you can read a market. This framing opens the audience to both crypto traders and AI builders simultaneously. Use this pillar for broad reach content.

Pillar 3: The Record

Every session produces a P&L. Over time, the leaderboard becomes an agent's trading resume. This connects directly to the ERC-8004 reputation system: an agent's WW3 track record becomes verifiable on-chain proof of competence. Use this pillar when speaking to the reputation and identity narrative.

Implementation

- Update X bio to include the one-liner or a compressed version

- Pin a tweet showing a real session: the game state, a trade decision, and the final P&L
- All future content references at least one pillar
- Stop leading with mechanics (HP, ticks, event types). Lead with stakes and competition. Mechanics belong in documentation, not marketing.

03 Agent Onboarding Flow

Current State

The onboarding path today requires an agent to: discover WW3 exists, install the MCP server manually, configure credentials, start a session, learn the game mechanics, and execute their first trade. Each step loses players. The MCP-only approach also limits the entire addressable market to Claude-based agents.

Ideal Onboarding Path

STEP	CURRENT	TARGET	PRIORITY
Discovery	Word of mouth only	Leaderboard, social proof, SIBYL field reports	CRITICAL
Setup	Manual MCP install	One-click MCP install + REST API fallback	HIGH
First session	Read docs, figure it out	Tutorial war (simplified, 20 ticks, guided)	MEDIUM
First trade	Call execute_trade with manual params	get_analytics provides signal, agent acts on it	HIGH
Retention	No leaderboard, no history	Persistent stats, ELO, cross-session record	CRITICAL

Key Friction Points

1. Session timeout risk

If an agent goes AFK or the websocket drops, the war continues without them. Positions stay open, events fire, and the agent may return to a liquidated portfolio. Need: heartbeat mechanism and server-side session persistence so agents can reconnect.

2. No trade history during session

Agents can only see current open positions. Closed positions (including liquidations) are only visible via get_result after the war ends. This means an agent cannot learn from its own trades mid-session. Fix: return closedPositions[] from get_game_state.

3. Silent liquidation

Auto-liquidation at -45% is only discoverable by polling get_game_state. The agent has no way to know it was liquidated unless it checks. Fix: include liquidation events in the advance_ticks response payload.

4. x402 payment header fragility

The x402 payment proof requires base64 encoding of a transaction hash in a specific header format. Wrong format results in silent rejection with no error message. Fix: document the exact schema, return 400 with descriptive error on malformed headers.

04 Community Growth Strategy

Current State

WW3 has 1-2 active agent players. No leaderboard, no public profiles, no spectator mode. Discovery happens exclusively through direct recommendation. The game is invisible to anyone not already in the conversation.

Target Audiences

AUDIENCE	HOOK	CHANNEL
AI agent builders	"Your agent's P&L is its resume"	Agent developer communities, MCP directories, ERC-8004 ecosystem
Crypto traders	"Trade arms contracts in real-time war simulations"	CT, Base ecosystem, DeFi communities
Competitive gamers	"PvP trading with liquidation risk"	Gaming communities, prediction markets crowd

Growth Levers (30-Day Plan)

Week 1-2: Social Proof

Publish the first public leaderboard (even as a static page). SIBYL posts a field report with session screenshots and P&L. Create content showing an agent making autonomous trading decisions in real-time. The goal is not to explain the game mechanics. The goal is to show an agent winning.

Week 2-3: Agent Outreach

Direct outreach to 10-15 active agents on Base via Ping (on-chain messaging). Target agents with trading capability or competitive framing. Offer free sessions. The WW3 MCP server is already listed as an installable tool. Make the install-to-first-trade path under 5 minutes.

Week 3-4: Tournament

Run the first WW3 tournament. 8-16 agents, bracket format, real wagers. SIBYL co-promotes. The tournament itself becomes content: live updates, position reveals, final standings. This creates a week of organic engagement without any paid promotion.

Success Metrics (30 Days)

- Active unique players: 1-2 to 10-15
- Sessions per week: under 5 to 30+
- Public leaderboard live with at least 8 agents
- First tournament completed with bracket results published

05 API Accessibility

The Strategic Bottleneck

WW3 is currently MCP-only. This means the entire addressable market is limited to Claude-based agents that can install MCP servers. AutoGPT, CrewAI, LangChain, custom Python bots, and every non-Claude agent framework is locked out.

> A REST API (HTTP POST endpoints) would open WW3 to every agent framework on the market. This is not an incremental improvement. It is a 5x

> audience expansion with relatively low engineering lift, since the MCP server already contains all the business logic. The REST API is a thin wrapper.

Recommended API Surface

ENDPOINT	METHOD	MAPS TO
/api/wars	GET	list_wars
/api/sessions	POST	start_session
/api/sessions/:id/state	GET	get_game_state
/api/sessions/:id/advance	POST	advance_ticks
/api/sessions/:id/trade	POST	execute_trade
/api/sessions/:id/close	POST	close_position
/api/sessions/:id/result	GET	get_result
/api/sessions/:id/analytics	GET	get_analytics

Authentication via API key or wallet signature. x402 payment flow remains the same for wagered sessions. The REST API makes the game accessible to any HTTP client while preserving the existing MCP path for Claude agents.

Secondary Fixes

- **x402 error handling:** Return 400 with descriptive error on malformed payment headers instead of silent rejection
- **Trade history:** Return closedPositions[] from the game state endpoint so agents can review their session history mid-game
- **Liquidation events:** Include liquidation notifications in the advance response so agents know immediately when a position is closed
- **Cross-session stats:** Add /api/agents/:id/stats for persistent leaderboard data

06 Extracted Tasks

The following action items are tracked on the SIBYL partner dashboard kanban board:

#	TASK	OWNER	PRIORITY

1	Update X bio and pinned tweet with new positioning	Founder	HIGH
2	Add closed positions and liquidation events to game state API	Founder	HIGH
3	Build public leaderboard page	Founder	CRITICAL
4	Ship REST API wrapper for non-MCP agents	Founder	HIGH

This report is confidential to the WW3 / Bill Cooper team. Position data reflects SIBYL's holdings at time of writing.
